## PREFACE

The data in this publication are being made available to agencies within the Department of Health, Education, and Welfare for planning and research purposes. The data were prepared under an interagency agreement between the Office of Policy, Planning, and Research, Health Care Financing Administration and the Social Programs Staff, Census Use Research, Statistical Research Division, Bureau of the Census. The Health Care Financing Administration(HCFA) wanted to obtain information on the living arrangements and institutionalization of the elderly at various geographic levels. The data were prepared for the States, HEW regions, and the United States. The data are for 1970, the most recent year for which detailed data on the living arrangements and institutionalization of various age groups of the elderly are available.<sup>1/</sup>

Persons interested in other data from the 1970 census will be able to obtain the Guide to Census Data on the Elderly after it is published in September 1978. Copies will be available through the Government Printing Office and the Subscriber Services Section, Bureau of the Census.

Given the time and budget constraints under which this study operated, every possible effort was made to edit and verify the data that appear in the following tables and maps. However, if errors remain, they should be reported to John F. Speight, Bureau of the Census, Washington, DC, 20233 ~~(301/763-2453/2588)~~ <sup>112-</sup>.)

Maps are included in this publication to indicate the variation in some of the major aspects of the living arrangements and institutionalization of the elderly. The data in the maps are taken from the tables.

Before using and interpreting the data in this publication, the reader should note the following sections on the sources and limitations of the data, accuracy of census data, and definitions of terms used in the tables and maps.

---

<sup>1/</sup> The 1976 Survey of Income and Education(SIE) provides information on a sample about four times the size of the Current Population Survey(CPS) conducted by the Census Bureau. However, the data on the elderly in the SIE are limited to persons 65 and over with no age detail for the elderly. Furthermore, institutionalized persons are not included in the SIE.

## SOURCES AND LIMITATIONS OF THE DATA

The purpose of the study in which these data were prepared was essentially descriptive. Selected characteristics of the living arrangements and institutionalization of the elderly were extracted from Census Bureau reports for the States and then aggregated to HEW region and United States levels. In a separate report sent to OPPR/HCFA the trends or patterns in the data that appear in this publication are summarized.

The data for this study were selected on the basis of the following criteria:

- General characteristics descriptive of the living arrangements and institutionalization of the elderly
- Availability of the data for all 50 States and the District of Columbia
- Availability of the data by age, race, and sex for computing age-race-sex specific percentages and rates
- Availability of the data for age intervals for persons 65 and over
- Potential utility of the data for a subsequently larger data base on the elderly and their long-term care needs.

The data for this study are estimates based on 1970 census data. The estimates were obtained by using ratio estimation procedures applied separately for the 5-percent and 20-percent samples.<sup>1/</sup> Two sources of 1970 census data were suitable to the design and objectives of the study:

- The PC(1)-D State reports, Detailed Characteristics, with the following tables:
  - 152. Marital Status, Presence of Spouse, and Whether Married More than Once, by Race, Sex, and Age: 1970 (5-Percent Sample Data)
  - 153. Persons in Households by Relationship to Head, 1970 and 1960, and by Race and Sex: 1970 (20-Percent Sample Data)

---

<sup>1/</sup> See the following section which includes a discussion of the sampling design and procedures for the 1970 census. Also, see the "Accuracy of the Data" appendix of any published report for the 1970 census for a detailed explanation of the ratio estimation procedures used to make estimates of population and housing characteristics from the 5-percent and 20-percent samples.

154. Persons in Group Quarters by Type of Quarters, Sex, Race, and Age: 1970 (20-Percent Sample Data)

- The PC(2)-4E Subject Report, Persons in Institutions and Other Group Quarters (various tables).

This publication presents the data in two forms: raw data and derived (relative) data. Some of the derived data (percentages and rates) should be interpreted with caution because of the small size of the denominators used. Rather than suppress those data, they are presented with notations that they must be interpreted with care.<sup>2/</sup> In general, the reader should exercise caution in the use and interpretation of the data for small subgroups of the population; these data are especially subject to the effects of sampling variability, misreporting, and processing errors.

The derived data in the tables and maps are displayed by age-sex-race specific percentages (marital status and household relationships) and rates (group quarters). The use of age-sex-race specific percentages and rates enables comparisons between and among 12 separate subpopulations:<sup>3/</sup>

- White males 65-74 years of age
- White males 75-84 years of age
- White males 85 years and over
- White females 65-74 years of age
- White females 75-84 years of age
- White females 85 years and over
- Black males 65-74 years of age
- Black males 75-84 years of age
- Black males 85 years and over
- Black females 65-74 years of age
- Black females 75-84 years of age
- Black females 85 years and over.

The data for elderly persons who indicated they were younger than the head of the household ("Family Members of Younger Generation") should be used with care, particularly those for persons 85 years and over. The distribution of the raw data from one age group to another looks suspect. Attempts to clarify this apparent anomaly in the data have proven unsatisfactory so far. One interpretation of the larger number of persons in this category of household relationships may be that the census question asking for each person's relationship to the head of the household was misunderstood. The person responding may have thought the question called for a statement of the relationship of the household head to her/him

---

<sup>3/</sup> Actually, with the raw data broken out for five five-year age groups (65-69, 70-74, 75-79, 80-84, and 85 and over), twenty separate subpopulations could be selected for comparisons.

rather than vice versa. This possible interpretation has not been subjected to a thorough investigation; thus, it is only speculation on the part of the preparers of this publication.

The 1970 census count of the population 65 years and over is estimated to be about 1.8 percent too low for the United States.<sup>4/</sup> However, there is considerable variation in the estimates of census error for different race-sex groups of the population. The reasons for under-enumeration of the population 65 years and over are that many of them were missed(not counted), age was misreported, and some duplication occurred. The missed rate increases with age and is especially pronounced for Nonwhite females. Coverage was better for Whites than for Nonwhites. The greatest estimated undercount was for Nonwhite males. Coverage was worse in the South than in other census regions, probably because of the larger Nonwhite population in the South. White females were also undercounted in the South. A higher proportion of misses occurred in rural areas than in urban areas; this was not limited, however, to the elderly population, but rather was true for the population as a whole.

The next section discusses the accuracy of census data, particularly sample data of the type used in this publication. Computational formulae for the standard errors to be used when making tests of significant differences between any two percentages, rates, or raw numbers in the tables and maps also are presented.

---

<sup>4/</sup> Bureau of the Census, The Medicare Record Check: An Evaluation of the Coverage of Persons 65 Years of Age and Over in the 1970 Census, Report PHC(E)-7, Washington, DC: Government Printing Office, 1973, pp. 1-3.

The data in this report are estimates derived from sample data collected in the 1970 Census of Population and Housing. There are two types of errors possible in estimates based on sample data -- sampling and non-sampling error. Sampling error occurs in making an estimate based only on a sample number of observations, rather than the entire population. Nonsampling error can be attributed to many sources: inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of the respondent to provide correct information, mistakes in recording or coding the data obtained, and other errors of collection, processing, coverage, and estimation for missing data.<sup>1/</sup> Nonsampling error can also occur in complete censuses.<sup>2/</sup> The accuracy of a survey result is determined by the joint effects of sampling and nonsampling errors.

### SAMPLE DESIGN

Data on a very small number of characteristics of individuals, households, and housing units were collected on a 100% complete basis in the 1970 Census of Population and Housing. However, most of the data from the 1970 census were collected on a sample basis. The sample design for the census consisted of a 20% sample subdivided into a 15% and a 5% sample. For persons living in housing units at the time of the 1970 census, the housing units, with all its occupants, was the sampling unit; for persons in group quarters identified in advance of the census, the sampling unit was the individual. Lists were prepared, either by canvassing the area of coverage, or in cooperation with the post office, and every fifth unit (housing unit for households and individual for those in group quarters) was designated a sample unit.

This sample was subdivided into a 5% and a 15% sample by designating every fourth 20% sample unit as a 5% sample unit. The remainder of the 20% sample was designated the 15% sample. Two sample questionnaires were used, one for each sample. Some questions were included on both questionnaires and make up the 20% sample. Other questions appeared on one or the other and make up the 5% and 15% samples.

---

<sup>1/</sup> The underenumeration of Blacks and other minority populations has been documented thoroughly in the literature.

<sup>2/</sup> The Bureau of the Census continues to publish evaluation reports on sampling and nonsampling errors in surveys (samples) and complete censuses. Since 1950, evaluation of coverage and other aspects of the 1950, 1960, and 1970 censuses have been published in series PHC(E) reports. A series of evaluation reports on the 1960 census, identified as series ER 60, contains extensive information on the magnitude of various types of nonsampling errors in the censuses.

Although the sampling procedure did not automatically insure an exact 20-percent sample of persons or housing units in each locality, the sample designed was unbiased if carried through according to instructions; generally for large areas, the deviation from 20 percent was found to be quite small. Biases may have arisen when enumerators failed to follow their listing and sampling instructions exactly. Quality control procedures were used throughout the census process, however, and where there was clear evidence that the sampling procedures were not properly followed, the work was returned to the field for resampling. No attempt was made to sample the relatively small numbers of persons and housing units (in most States, less than one percent) added to the enumeration from the post-census post office check, the various supplemental forms, and the special check of vacant units.

### SAMPLING VARIABILITY

The estimates of the population characteristics included in this report are subject to sampling variability. The chances are about two out of three that the difference (due to sampling variability) between the sample estimate and the figure that would have been obtained from a complete count of the population is less than the standard error. The chances are about 19 out of 20 that the difference is less than twice the standard error and about 99 out of 100 that the difference is less than  $2\frac{1}{2}$  times the standard error. The amount by which the estimated standard error must be multiplied to obtain other odds more appropriate can be found in most statistical textbooks. Rather than approximate the standard errors of those estimates by using procedures and tables routinely published in all Bureau of the Census 1970 census reports, the estimated standard errors of the percentages, rates, and raw numbers in this publication can be calculated directly, using commonly accepted computational formulae.

Assuming samples of five and twenty percent, the standard error of an estimate can be calculated with the following formulae:

- Five-percent sample:  $S. E.(\hat{x}) = \frac{1}{N} \sqrt{19 \hat{x} (1 - \frac{\hat{x}}{N})}$
- Twenty-percent sample:  $S. E.(\hat{x}) = \frac{1}{N} \sqrt{4 \hat{x} (1 - \frac{\hat{x}}{N})}$ ,

where

- $S. E.(\hat{x})$  = standard error of the estimated percentage, rate, or number
- $\hat{x}$  = the estimated percentage, rate, or number
- $N$  = the denominator of the estimated percentage, rate, or number (actually,  $N$  is also an estimate).

The general formula for computing the standard error of an estimate from census data is:

$$S. E.(\hat{X}) = \frac{1}{N} \sqrt{\left(\frac{1-f}{f}\right) \hat{X} \left(1 - \frac{\hat{X}}{N}\right)},$$

where  $f$  is the sampling fraction or rate (eg., .05, .15, .20, etc.).

The standard error of an estimate would depend upon the magnitude of the estimate as well as the magnitude of the denominator or base of the estimate.

Once the standard error of an estimate is calculated, the sampling error may be obtained by multiplying the standard error by the appropriate factor in figure 1. These factors must be used to adjust the standard error for the combined effect of the sample size (i.e., whether a 5-percent or 20-percent sample), the sample design, and the estimation procedures used. This adjustment for sampling error, however, does not account for bias arising in the collection, processing, and estimation steps, or for the correlated errors caused by different enumerators.

The total error of an estimate, which depends upon the joint effects of the sampling, response, and operational errors, is usually of the order of magnitude indicated by the standard error of the estimate, or only moderately higher; for particular estimates, however, the total error may exceed considerably the estimated standard errors. Estimates of the magnitude of some of these factors in the total error have been evaluated and are being published by the Bureau of the Census in its series PHC(E) reports.

FIGURE 1

FACTORS TO APPLY TO THE STANDARD ERRORS OF  
THE CHARACTERISTICS IN THIS REPORT<sup>1/</sup>

Characteristics	Sample or Tabulation Rates	
	5%	20%
Age	1.8	0.8
Race	2.5	1.1
Sex	1.0	1.0
Marital Status	1.4	N/A <sup>2/</sup>
Household Relationships	N/A	0.5
Group Quarters	N/A	0.6

<sup>1/</sup> These factors were taken from the PC(1)-D Summary Report, Detailed Characteristics, for the United States. The factors in this figure are thus for the United States, not individual States. The factors for each of the States are available in the individual PC(1)-D reports for the States. The factors for the United States can be used for each of the HEW regions and States, but with some caution. A brief comparison of the factors in the individual State PC(1)-D reports indicated that the most divergence from the United States factors occurred for the race characteristic. The factors for the other characteristics varied very little (on the order of 0.1 - 0.2) from the United States "average" (factor). The range of the race factor in the individual State PC(1)-D reports was on the order of 0.9 - 1.7 for the 20-percent sample and 1.9 - 3.8 for the 5-percent sample. The race factors for the States tended to be highest in the areas where the Nonwhite population was the smallest. Those areas were west of the Mississippi River and in New England.

<sup>2/</sup> N/A = Not Applicable

## DEFINITIONS OF TERMS

### 1.0 Marital Status

- 1.1 Single - Never married.
- 1.2 Married - Includes married only once and remarried after widowhood or divorce.
- 1.3 Widowed - Not remarried after spouse died.
- 1.4 Divorced - Legally divorced and not remarried.

### 2.0 Household - All persons who occupy a group of rooms or a single unit which constitutes a housing unit.

### 3.0 Persons in Household

- 3.1 Head of Household<sup>1/</sup> - Person in each household designated as "head", that is, the person who is regarded as the head by members of the household. There are two types of household heads:

- Primary individuals
- Heads of families

- 3.1.1 Primary Individual - Household head living alone or with nonrelatives only.

- 3.1.2 Head of Family - Household head living with one or more persons related to him by blood, marriage, or adoption.

- 3.2 Family - Two or more persons living in the same household who are related by blood, marriage, or adoption.

- 3.3 Persons in Families by Relationship to Head of Household

---

<sup>1/</sup> In the 1980 census the Census Bureau plans to discontinue the use of the terms "head of family" and "head of household." Instead, the terms "family householder" and "householder" are likely to be used. Recent social changes have resulted in a trend toward more equal social status for adult members of a household and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. In the 1980 census, the householder will be the first adult household member listed on the census questionnaire. The enumerator instructions call for listing first the person (or one of the persons) in whose name the house is owned or rented. If a home is owned or rented jointly by a married couple, either the husband or wife may be listed first and thereby become the reference person, or householder, to whom the relationship of other household members is recorded.

- 3.3.1 Wife of Head - A woman married to and living with a household head, including women in common-law marriages as well as women in formal marriages.
- 3.3.2 Family Members of Younger Generation - Include the child of head, the grandchild of head, and the son or daughter-in-law of head.
- 3.3.3 Family Members of Older Generation - Include the parents of the head or the wife.
- 3.3.4 Family Members of Same Generation - Include brother or sister of head or wife.
- 3.3.5 Other Relative of Head - Persons related to the household head by blood, marriage, or adoption, who are not included in one of the preceding four categories.
- 3.4 Persons in Families - Include the heads of families, the wives of heads, family members of younger, older, and same generations, and other relatives of heads.
- 3.5 Secondary Individuals - Unrelated individuals in a household who are not household heads. There are two types of secondary individuals in a household:
- Lodgers (or partners)
  - Resident employees
- 3.5.1 Lodgers (or Partners) - Household members not related to the household head.
- 3.5.2 Resident Employees - Employees of the household (such as maid, cook, hired farm hand, companion, nurse) who usually reside in the housing unit. Also include the employees' relatives living in the same housing unit. Resident employees are not listed as a separate category in this publication, but are included in "persons in households."
- 3.6 Persons in Households - Include primary individuals, persons in families, and secondary individuals.

4.0 Group Quarters - All persons not living in households are classified as living in group quarters. A living quarters is called a group quarters if there are five or more persons unrelated to the head; or, when no head is designated, if six or more unrelated persons share the unit.<sup>2/</sup> There are two types of group quarters:

- Institutions
- Group quarters other than institutions

4.1 Rooming or Boarding Houses - Group quarters where no household head is designated and six or more unrelated persons share the unit.<sup>3/</sup>

4.2 Institutions - Group quarters where care or custody is being provided at the time of enumeration. The length of stay and number of persons in the quarters is disregarded.

4.2.1 Mental Hospitals - Includes mental hospitals as well as psychiatric wards or services of general hospitals and of veterans hospitals, and alcoholic treatment and drug addiction centers. Institutions combining psychiatric care with care for the mentally handicapped are defined as mental hospitals. However, the neurological services of Veterans' Administration hospitals are defined as belonging in the category of chronic disease hospitals (except tuberculosis and mental), and psychiatric facilities for prisoners under the control of State departments of corrections are classified as prisons.

---

<sup>2/</sup> Certain other types of living arrangements are classified as group quarters regardless of the number or relationships of people in the unit. These include military barracks, ships, college dormitories, sorority and fraternity houses, short-term medical and surgical wards of hospitals (for patients with no usual residence elsewhere), missions, flophouses, Salvation Army shelters, railroad stations, and so on. These types of group quarters are not treated separately in this publication.

<sup>3/</sup> Other group quarters meeting this definition, but not included as separate categories in this publication, are communes, workers' dormitories, and convents or monasteries.

4.2.2 Homes for the Aged (and Dependent) - Comprises a heterogeneous group of quarters in which the great majority of the inmates are older persons. However, persons who are economically dependent or who require nursing care because of chronic physical conditions may be found in these homes regardless of their age. These homes have been classified into those "known to have nursing care" and those "not known to have nursing care". For the most part, the latter group of homes offers only domiciliary or personal care.<sup>4/</sup>

4.3 Inmates of Institutions - Persons under care or custody in institutions at the time of enumeration are classified as "inmates". The nature of the service provided by an institution was the determinant for classifying inmates by type of institution. For institutions which specialize in only one specific type of service, all inmates are given the same classification. For those institutions with multiple types of major service, usually general hospitals and Veterans' Administration hospitals, inmates are classified according to selected types of wards. For example, patients in psychiatric wards are classified as inmates of mental hospitals while patients in chronic disease wards are classified as inmates of chronic disease hospitals. Each inmate is classified in only one type of institution.

---

<sup>4/</sup> Information on homes for the aged and dependent by these two categories can be found in: Bureau of the Census, Census of Population: 1970, Final Report PC(2)-4E, Persons in Institutions and Other Group Quarters, Washington, DC: Government Printing Office, 1973, various tables.

- 4.4 Persons in Institutions - Includes persons in mental hospitals, homes for the aged, and all other inmates of institutions(not shown separately in this publication).
- 4.5 Other Group Quarters - Include general hospitals (including quarters for staff), missions or flop-houses, ships, religious group quarters such as convents or monasteries, dormitories for workers, sorority and fraternity houses, military barracks, and so on.
- 4.6 Persons in Group Quarters - Includes persons in rooming or boarding houses, institutions, and all persons in group quarters not shown separately in this publication.

A map of the United States showing the average number of children per woman by state in 1960. Each state is labeled with its name and a numerical value. The values range from 0.0 in Alaska to 8.6 in Nevada. A scale bar indicates distances up to 400 miles. An inset map shows the location of the United States in the world.
